Basic info about the running containers

Links to access the running services in the container

Links to terminate (you will be asked to confirm), stop or restart containers. Note: ideally have only one container at a time running, to not overtax system resources. Also stop all containers before rebooting host server (**they persist after reboot**).

Do quickly for all containers with Bulk Actions.

Create a new image from the container, e.g., after having installed new programs or packages
